

A Data-Distribution and Successive Spline Points based discretization approach for evolving gene regulatory networks from scRNA-Seq time-series data using Cartesian Genetic Programming

Removed due to double-blind review.

Supplementary Material

This supplementary material presents additional details and extra tabular results when solving the proposed benchmark problems for assessing the performance of the proposal.

1 Curated Problems

Tables 1 and 2 present the tabular results when solving the curated problems considering the AUPRC and AUROC of the median values. The values are presented considering the worst, first quantile (Q1), mean, median, third quantile (Q3), best, and standard deviation (STD) values.

Table 1: Values of AUPRC for the median case. The best results are in boldface.

	Prob.	Alg.	Worst	Q1	Mean	Median	Q3	Best	Std.

2 Parameter Sensitivity Analysis

Table 3 presents the tabular results of the parameter sensitivity analysis considering the median values. The first column is the area under (AU) the precision-recall curve (PRC) and the receiver operating characteristic curve (ROC), respectively. Negative values indicate that the parameter generated worse results than the reference (0.02).

Table 3: Parameter sensitivity analysis for the median case. The values are the relative difference between several values for μ_{var} . The reference is $\mu_{var} = 0.02$.

AU	μ_{var}	GSD	0% dropout			GSD	50% dropout			GSD	70% dropout		
			HSC	mCAD	VSC		HSC	mCAD	VSC		HSC	mCAD	VSC
